AGENT6

ENTERPRISE AGENTIC AI PLATFORM

Turn Complex Workflows Into Action.

Custom AI agents for the documents, systems, and decisions that keep work moving.

Agent6 is an enterprise agentic AI platform for building and deploying custom AI agents tailored to your business processes. It brings together information, business rules, system actions, and human review to coordinate multi-step workflows with visibility and control.

Three ways Agent6 moves work forward

COORDINATE
Organize tasks, rules, and approvals into workflows.

EXECUTE
Perform authorized actions across connected systems.

TRACK
Monitor progress, exceptions, and review activity.

How Agent6 works

An example workflow for document-intensive operations. Steps and review requirements are configured for each use case.

1 INTAKE
Receive documents and information from configured sources.

2 EXTRACT
Capture required fields and prepare structured information.

3 VALIDATE
Check completeness and flag missing, duplicate, or inconsistent information.

4 REVIEW
Send exceptions and approvals to designated reviewers when required.

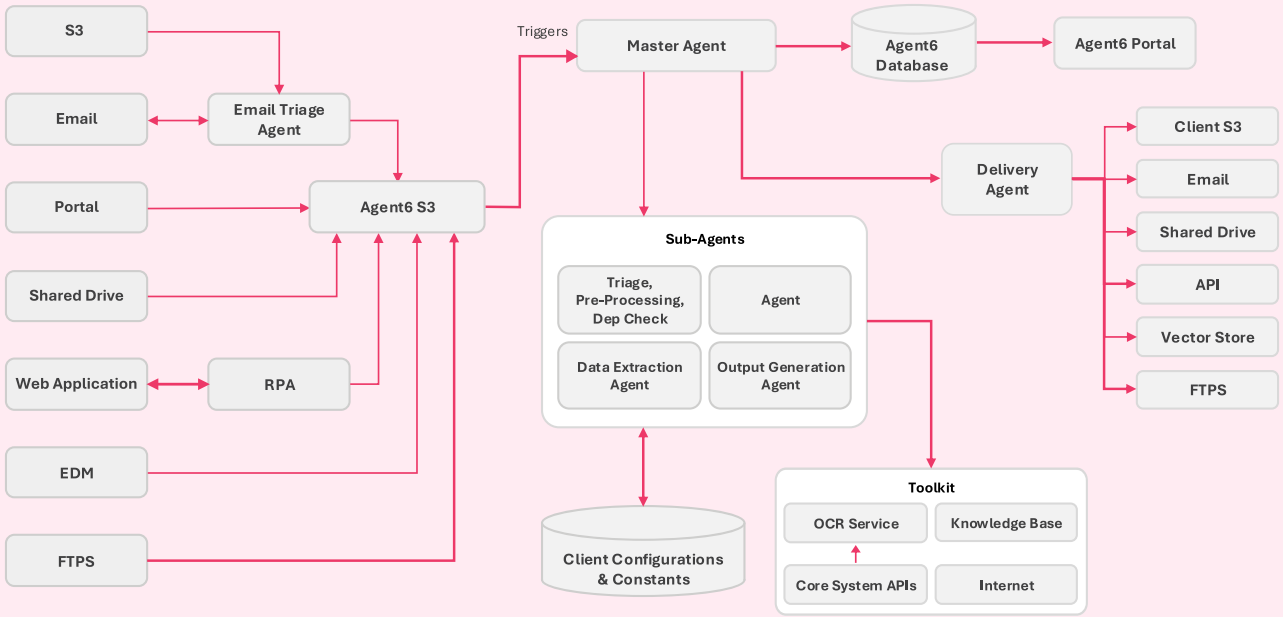

5 DELIVER
Move approved information or actions to the next workflow step.

Where Agent6 can fit

- Document and case intake
- Exception management
- Approval-heavy operations
- Connected operational tasks

Connect the process. Move the work.

The workflow below summarizes a reference implementation in which Agent6 coordinates incoming information, specialist agents, connected tools, and delivery across enterprise systems.

* Based on an **Agent6** implementation for an active enterprise client.

INPUT SOURCES & INTAKE

Email, portals, shared drives, web applications, and file transfers feed the workflow through configured intake paths.

AGENT ORCHESTRATION

A master agent coordinates triage, pre-processing, document checks, data extraction, and output generation, using configured services and APIs.

DELIVERY & SYSTEMS

A delivery agent connects outputs to approved destinations. The Agent6 portal and database support the implemented process.

Core capabilities

Custom workflow agents

Configure agents around tasks, rules, exceptions, dependencies, and required outputs.

Data intake and extraction

Collect information from configured inputs, classify documents, and prepare structured data.

Validation and discrepancy checks

Identify missing, duplicate, inconsistent, or conflicting information for handling.

Review and approval routing

Send cases to the appropriate queue, team, or approver based on defined rules.

Enterprise system integration

Connect with existing applications, APIs, and approved data sources for workflow actions.

Status tracking and auditability

Monitor processing status, exceptions, review activity, and workflow results.

Bring us one workflow.

Share a process with repeat work, exceptions, or multiple handoffs. We will discuss where Agent6 fits, the systems and controls involved, and a practical next step.
